

Project title: Nursery School Management System. Academic Year: 2023

Group Members: Masa Hassan Masri. Department Name: Computer Engineering.

Rahaf Omar Nasrallah.

Project Type **Software**

Supervisor Name: Dr. Abdullah Rashed.

Project's Abstract:

Some nursery schools rely on notebooks to write what the kids ate, the amount of it and naps intervals, the parent sees the notebook after picking up their child, but this is unreliable since it doesn't provide real time connection with parents.

This app lets parents enroll their kids, and get daily secure messages showing them how and what their children are doing at school. Teacher to parent communication is more vital than ever. From naps and snacks, to magic moments or what happened when they tripped over in the garden and bumped their knee, parents have to always be a part of their child's journey. As parents nowadays spend more time away from their kids.

This project covers aspects like chatting, a feed to show kids activities, naps intervals, incidents and whom children are involved in, meal times and types, administration of the nursery school, registering kids and monitoring installments.

We hope this project can also make a difference on the administrative side of things, The head of these schools can access information and reports and deal with what their job entails in an easier, more practical way.

We also hope that through this project the communication between the parents and babysitters will be smoother, this can be very helpful especially for working moms.

This project can be a great step for the nursery school management in our country.

The idea of specifying a platform for keeping a connection between the children and their teachers exists somewhere and we've encountered some softwares that deals with the same concept but not in any nursery school in our country.
