

Dosimetric Evaluation for Eye Lens and Thyroid Gland from Brain Computed Tomography Scan

Prepared By: Haya Jamal Alruzieh

Supervisor: Dr. Ali Abu Arra

A Thesis Submitted in Partial of Requirements for the
Bachelor's Degree of Medical Imaging.

An-Najah National University

January 2022

ACKNOWLEDGEMENT

May Allah, the Founder of the world, have mercy on us all. Special thanks are given to Dr. Ali Abu Arra for his sponsorship of my studies, for his endurance and inspiration. Also, I would like to send special thanks to my dear teachers, Prof. Abed Al-Nasser Assi and Dr. Jihad Ahmad Alshanti who dedicated themselves to teaching and sharing all their knowledge.

Endless sincere gratitude to my family, to my mother who was always by my side and was my biggest supporter, for my father's soul who struggled to provide the best education and life for me -may Allah rest his soul in peace- , and my brothers and sisters who believed in my dream and gave me strength every day.

I would like to thank my dear friends who have been with me all the time, especially Roaa Barabrah for her assistance. I am very much thankful to my lovely childhood friends in Saudi Arabia who have always been there for me and supported me. Finally, I would like to express my appreciation to Mr.Samir Awrtani for his assistance during my educational career.

Haya Alruzieh

تقييم الجرعات الإشعاعية لعدسة العين والغدة الدرقية من فحص التصوير المقطعي المحوسب للدماغ

الملخص

يعد التصوير المقطعي للدماغ من أحد أكثر الفحوصات شيوعاً في السنوات الأخيرة. تهدف هذه الدراسة إلى تقدير الجرعة الفعالة (ED) وجرعة الأعضاء من التصوير المقطعي للدماغ ، واحتمالية إصابة الغدة الدرقية بالسرطان نتيجة التعرض للإشعاع، لتحقيق هدف هذه الدراسة، تم تقدير الجرعة باستخدام الحساب اليدوي وبرنامج VirtualDoseTM القائم على مونت كارلو والمتوفر تجارياً .

تم اختيار 80 مريضاً بالغاً عشوائياً من كلا الجنسين من مستشفى الشهيد ثابت ثابت. حيث تم تطبيق أوضاع المسح الحلقونية والمحورية للدماغ. تم تسجيل البيانات الديموغرافية للمرضى ، ومعلومات المسح ، ومؤشرات الجرعة التي تتضمن كيلوفولتاج أنبوب الأشعة السينية (kVp) ، ملي أمبير في الثانية (ملي أمبير) ، منتج طول الجرعة (DLP) ، حجم مؤشر جرعة التصوير المقطعي المحوسب (CTDIvol) .

أظهرت الدراسة أن متوسط قيمة الحساب اليدوي هو 1.8 ملي سيفرت مقارنة بمتوسط قيمة الجرعة الفعالة باستخدام VirtualDoseTM 5.0 ملي سيفرت للمسح الحلقوني. بينما في الفحص المحوري ، يبلغ متوسط قيمة الحساب اليدوي 2.4 ملي سيفرت مقارنة بمتوسط قيمة VirtualDoseTM 4.1 ملي سيفرت.

بالنسبة للمسح الحلقوني ، كانت أعلى قيمة محسوبة 2.1 ملي سيفرت ، تنتمي إلى إنثى تبلغ من العمر 82 عامًا. أما المسح المحوري ، كانت أعلى قيمة للجرعة الفعالة محسوبة 2.9 ملي سيفرت ، لأنثى في سن 55 عامًا. استناداً إلى برامج VirtualDoseTM ، في المسح الحلقوني ، أعلى قيمة هي 6.5 ملي سيفرت ، لأنثى تبلغ من العمر 81 عامًا. من ناحية أخرى ، في المسح المحوري ، كانت أعلى قيمة 8.3 ملي سيفرت تخص أنثى تبلغ من العمر 55 عامًا.

كان متوسط قيم جرعات الأعضاء في جميع المرضى 43.1 و 19.7 ملي جراي للغدة الدرقية و عدسة العين ، على التوالي في المسح الحلقوني. بينما كان المسح المحوري 9.1 ملي جراي للغدة الدرقية ، و 32.1 ملي جراي لعدسة العين. أعلى قيمة في تقدير احتمالية الإصابة بسرطان الغدة الدرقية للمسح الحلقوني هي 2.3×10^6 عند الإناث البالغات من العمر 20 ، 68 عامًا. أيضاً، أعلى قيمة للمسح المحوري 2.7×10^6 لأنثى تبلغ من العمر 55 سنة.

بشكل عام، جرعات الإشعاع المحسوبة من فحوصات التصوير المقطعي المحوسب للدماغ في هذه الدراسة ضئيلة ومماثلة لتلك الجرعات الموصوفة في الأعمال الأخرى، ومع ذلك يجب على فني الأشعة اختيار وتعديل البروتوكولات لتجنب الإشعاع غير الضروري للمرضى وتلبية مبدأ أدنى مستوى يمكن تحقيقه بشكل معقول (ALARA).

Dosimetric Evaluation for Eye Lens and Thyroid Gland from Brain Computed Tomography Scan

ABSTRACT

Brain Computed Tomography scan is one of the most frequent examinations in the last years. This study was aim to estimate the effective dose (ED) and the organ doses from brain computed tomography (CT) scan, and cancer probability was for the thyroid gland.

The manual calculation and commercially available Monte Carlo-based software VirtualDoseTM CT were used to achieve the objective of this study. A total of 80 adult patients from both genders were selected randomly from the Thabet-Thabet hospital. Helical and axial scan modes were applied. Demographic data for patients, scanning parameters, and dose indicators that involve the x-ray tube kilovoltage (kVp), milliamperere-second (mAs), dose length product (DLP), computed tomography dose index volume (CTDI_{vol}) were recorded.

The average value of ED_{DLP} is 1.8 mSv compared to ED_{Virtual} with an average value of 5.0 mSv for the helical scan. In an axial scan, the average value of ED_{DLP} is 2.4 mSv compared to ED_{Virtual} with an average value of 4.1 mSv. For Helical Scan, the highest calculated ED value was 2.1 mSv, belonging to females aged 82 years. For Axial Scan, the highest calculated ED value was 2.9 mSv, belonging to females aged 55 years old.

Based on virtual software, in the helical scan mode, the highest value is 6.5 mSv, belonging to a female who is 81 years old. On the other hand, in the axial scan, the highest value was 8.3 mSv belonging to a female who is 55 years old.

The average values of organ doses in the whole population were 43.1 and 19.7 mGy for the thyroid gland and eye lens, respectively in helical Scan. While axial scan was 9.1 mGy for thyroid, and 32.1mGy for eye lens. The highest value in thyroid cancer risk assessment is 2.3×10^6 found in 2 females who are 20, 68 years old in the helical scan. Also, for the axial scan, the highest value is 2.7×10^6 belonging to a female who is 55 years old. Generally, the calculated radiation doses from the brain CT exams in this study are minimal and similar to those described in other works of literature, however, the technologist should choose and adjust protocols to avoid unnecessary radiation to patients and satisfy the as low as reasonably achievable (ALARA) principle.

Keywords: CT, Organ dose, Effective dose, Radiation cancer risk.
