

As part of my graduation project, I developed a mobile application called 'Qadaa.' The application aims to improve the accessibility of legal services and facilitate communication with lawyers in Palestine. It features a user-friendly interface and a comprehensive set of features, including streamlining legal procedures, communication with lawyers through chat and calls, appointment booking, providing directions to lawyer offices, and creating a forum for legal discussions. The application was built using modern development techniques, resulting in a secure and efficient platform that enhances user access to legal services. Throughout the project, I showcased my skills in mobile app development and software engineering, delivering a valuable solution to real-world challenges
